DESCRIPTION

Rho is dihydroiso-alpha-acids (DHIAA) in pure resin extract form and typically contains 30% w/w of DHIAA when measured by HPLC and more than 35% w/w of DHIAA when measured by UV Spectrophotometer and less than 1.0% w/w of IAA (iso-alpha-acids). Rho is produced from CO2 hop extract by simultaneous isomerization and BH4- reduction. The purity of Rho is typically more than 85% w/w. Formulation and packaging of Rho have been designed to make it a user friendly and economical hop ingredient.

PACKAGING & STORAGE

Standard packaging is available in 20 KG deltangular tight-head PET containers. Rho should be stored at room temperature, preferably between 59°F and 77°F (15°C and 25°C). Under these conditions, Rho will remain stable in closed container for two (2) years. A precipitate may form during storage, to re-dissolve, warm the container to 120°F (50°C) and then agitate. Opened containers should preferably be used within one (1) month.

APPLICATION & USAGE

Rho as 100% of the hop bill or in conjunction with other light stable hop extracts for the hopping of light stable beers. Rho is stable to light and will not contribute to the development of sun-struck flavors. Rho is supplied as a pure resin extract to facilitate direct addition. Addition of Rho is a convenient means of getting DHIAA into the beer. The addition means that the hop acids will be present in the fermenter providing anti-microbial protection. Rho as part of your hop formulation to differentiate beers. Bitterness intensity is 0.7 times the bitterness per BU when compared to iso-alpha acids. The bitterness profile is smoother than iso-alpha acids, leaving a full body mouth feel with little after bitter. This can be perceived at high concentrations (>10 ppm). Formulation of the hop bill with various ratios of IAA:DHIAA:THIAA can provide a wide range of flavors. Yakima Chief Hops recommends the direct, undiluted addition of Rho into the brew.

USE RATE CALCULATIONS

The addition of 200 gm of DHIAA of Rho per equivalent 100 HL of finished beer will provide 10 BU. Note the above recommended addition rate is per 100 HL of finished beer. To calculate grams per hectoliter based on 70% utilization and 0.7 times the bitterness of iso-alpha acid use: **kg product = (IBU / 0.7) / 70 x hl / 30**
Where: IBU = international bitterness unit desired, hl = is hector liters of finished beer (1 barrel = 1.173 hectoliters).

CHARACTERISTICS

Flavor of a solution in de-ionized water containing 10 mg/L of dihydroiso-alpha-acids: A fine bitterness with no other detectable flavors
Aroma of a solution in de-ionized water containing 10 mg/L of dihydroiso-alpha-acids: None detectable
Gushing potential in beer: No increased potential
